1.0 SCOPE

This specification defines the Human Research Facility (HRF) program requirements for the Total Force Foot Ground Interface (TF-FGI), P/N SEG46118238-301. The TF-FGI consists of Criticality 3 hardware that will be used to support the HRF.

The primary governing document for the requirements levied in this document is LS-71000, Program Requirements Document for the Human Research Facility. Other requirements are derived from SSP 57200, Human Research Facility – Rack One Hardware Interface Control Document, and interface requirements documents for the various items of HRF equipment.

The requirements in Sections 3, 4, and 5 of this document consist of a minimum set of constraints for Criticality 3 hardware and software. Criticality 3 items are defined in Section 3.2 of LS-71000A. Provisions for verification and subsequent use of Criticality 3 equipment as part of the HRF program are delineated in Section 5 of LS-71000.

The TF-FGI shall be reviewed through the Johnson Space Center (JSC) Payload Safety Review Panel (PSRP) for Safety Certification and JSC/NT3 Reliability for designation as Criticality 3 hardware.

The HRF Project Office is the controlling authority for this document. The HRF Configuration Control Board (CCB) or a delegated authority must approve any deviations from the requirements of this document. Any change in functionality that requires equipment designated as Criticality 3 to be used in a manner that is not consistent with the requirements specified herein and in LS-71000 will require that item or items to be reassessed for criticality as well as applicability of this document.

2.0 APPLICABLE DOCUMENTS

The following applicable documents of the exact issue shown herein form a part of this specification to the extent specified herein. If a revision level or date is not cited, the latest version of the document should be used.

All specifications, standards, exhibits, drawings or other documents referenced in this specification are hereby incorporated as cited in the text of this document.

2.2 ORDER OF PRECEDENCE

In the event of a conflict between the text of this specification and references cited herein, the text of this specification takes precedence. Nothing in this specification, however, supersedes applicable laws and regulations unless a specific exemption has been obtained.

3.0 SYSTEM REQUIREMENTS

3.1 ITEM DEFINITION

The Total Force Foot Ground Interface (TF-FGI) will be designed and certified under this requirements document for use on the International Space Station (ISS) as a part of the HRF program. HRF hardware used with the TF-FGI is certified under separate documentation, which is maintained by the appropriate program(s).

Table 3.1-1 lists the equipment items covered by this document including the stowage kits that will be used to transport the items and contain the items on-orbit.

TABLE 3.1-1. TOTAL FORCE FOOT GROUND INTERFACE EQUIPMENT

Item Name	Part Number	Notes
Total Force Foot Ground Interface Box	SEG46118240-301	
Total Force Foot Ground Interface Insole Assembly	SEG46118241-301 through -321	Dependant on crew-member size
Battery Kit	SED46107213-302	Replacement 9V Batteries
TF-FGI Stowage Kit	SJG46118348-301	

Table 3.1-2 lists the software items covered by this document.

TABLE 3.1-2. TOTAL FORCE FOOT GROUND INTERFACE SOFTWARE

Item Name	Part Number	Notes
Total Force Foot Ground Interface Firmware	SEG46118286-301	Any firmware updates will be performed on the ground.

Deliverables consist of:

4	TF-FGI	Flight Units
1	TF-FGI	Qualification Unit
1	TF-FGI	Prototype Unit

3.1.1 Item Description

The TF-FGI will be a human instrumentation system component of the HRF on board the ISS. The TF-FGI will provide a primary means to dynamically measure the total force exerted on each foot by the crewmembers during normal work, training, and exercise routines. The hardware will be crew worn and will interface with other HRF hardware items.

The TF-FGI consists of the following components:

A. TF-FGI Box

The TF-FGI box consists of a Printed Wiring Assembly (PWA) contained within an aluminum housing. All components, other than external batteries, are contained on the single PWA. Common alkaline nine-volt batteries provide a minimum lifetime of 12 hours of operation.

The TF-FGI PWA is an analog signal conditioning circuit. It interfaces with the Novel insoles, which are used as the sensors, and with the HRF Ambulatory Data Acquisition System (ADAS), which acts as the data acquisition and storage unit.

The TF-FGI Printed Wiring Assembly incorporates semi-automatic calibration of the individual insoles through the use of an on board microcontroller. Reprogramming of the microcontroller can be performed on the ground using Ground Support Equipment (GSE). The TF-FGI firmware can be downloaded from a computer via an EPIC programmer, which connects to a 10-pin header on the PWA.

A diagram of the TF-FGI box is shown in Figure 3.1.1-1.

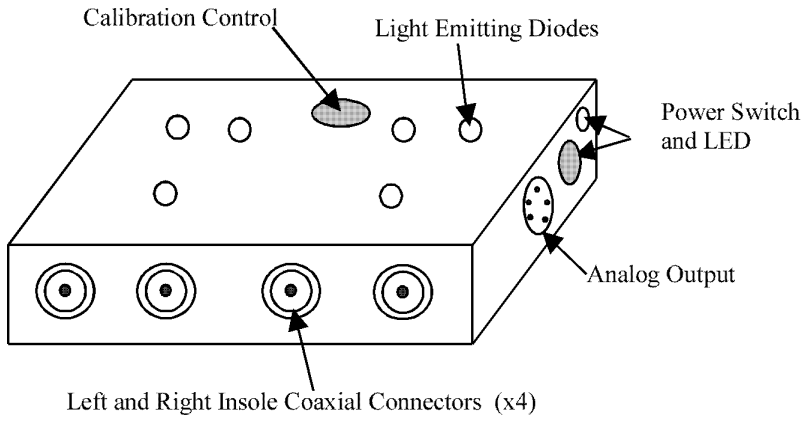

Figure 3.1.1-1. TF-FGI Box Diagram

B. TF-FGI Insole Assembly

The TF-FGI Insole Assembly consists of a pair of Novel insoles (left and right) with a connector housing and two electrical socket connectors attached to each insole. The Novel insole connectors are embedded in the

silicone connector housing to prevent disconnection and the two external electrical socket connectors are used to interface with cables in the Lower Extremity Monitoring Suit (LEMS). Each insole consists of 99 individual capacitive pressure sensors distributed over the entire insole surface area. Compression of the insole surface varies the output signal, which is transferred to the TF-FGI box via a cable in the LEMS.

A diagram of the TF-FGI Insole Assembly is shown in Figure 3.1.1-2.

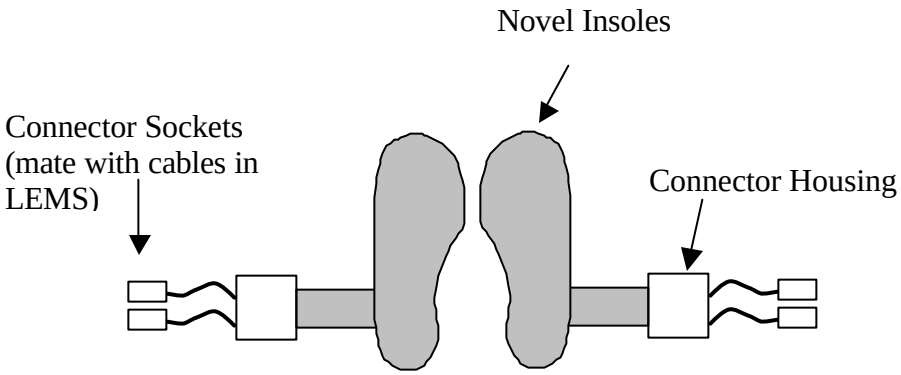

Figure 3.1.1-2. TF-FGI Insole Assembly Diagram

3.1.1.1 Experiment Overview

The TF-FGI hardware will be part of the E318 Foot Reaction Forces During Space Flight Experiment. This experiment will quantify human mechanical loading during periods of time, which represent typical activities of daily life, both on Earth and during missions on the International Space Station (ISS). Results of the experiment will be used in the development of countermeasures to lower extremity muscle and bone loss on future space station missions. The TF-FGI will be a human instrumentation system component of the HRF on board the ISS. It will provide a primary means to dynamically measure the total force exerted on each foot by the crewmembers during normal work, training, and exercise routines.

3.1.1.2 Operational Overview

The TF-FGI will be used in two operational modes: calibration and data collection.

For calibration of the insoles, the TF-FGI will be used in association with the Foot Ground Interface (FGI) Flight Calibration Unit (FCU), P/N SEG33110402-301, and the LEMS. The insole to be calibrated will be placed within the calibration unit. The FCU will be connected to the HRF Rack nitrogen interface. The

crewmember will control the flow of nitrogen to a bladder within the FCU, exerting a stable, uniform load on the insole. Once a specified pressure level is reached, a calibration button on the TF-FGI box will be pressed. The calibration procedure will then be repeated for the other insole. (NOTE: The LEMS will not be crew worn in this operational mode.)

For data collection, the crewmember will don the LEMS. The insoles will be placed within the crewmember's shoes, and the TF-FGI insole assemblies will be connected to cables in the legs of the LEMS. The TF-FGI box will be connected to the other end of the cables and also to the ADAS. Data output from the insoles will be transferred to the TF-FGI box and then to the ADAS where it will be stored on Personal Computer Memory Card International Association (PCMCIA) cards.

3.2 CHARACTERISTICS

3.2.1 Performance Characteristics

3.2.1.1 Functional Performance Characteristics

A. The TF-FGI shall be capable of interfacing with the Ambulatory Data Acquisition System (ADAS).

B. The TF-FGI shall be capable of interfacing with the LEMS.

C. The TF-FGI shall be battery powered.

D. The TF-FGI shall allow for semi-automatic calibration of the individual insoles using a microcontroller.

E. Green Light Emitting Diodes (LEDs) shall be used to provide a simple calibration menu.

F. A red blinking LED shall be used to warn of a low battery condition.

G. Protection devices shall be provided in case of catastrophic failure of the circuit.

H. The FGI insoles shall be capable of at least 60,000 loading cycles per insole.

I. The TF-FGI accuracy shall be ± 5%.

J. The TF-FGI shall allow for reprogramming of the internal microcontroller.

K. The voltage range for each battery shall be 8.8-9.8 V.

3.2.2 Physical Characteristics

3.2.2.1 Mass Properties

The mass of the TF-FGI shall not exceed 21.8 kg (48 lb.).

3.2.2.2 Envelope

3.2.2.2.1 Stowed Envelope

Dimensions of the stowed TF-FGI shall not exceed 16.2 in (W) x 20.32 in (D) x 5.9 in (H).

3.2.2.2.2 Deployed Envelope

Not applicable to the TF-FGI.

3.2.3 Reliability, Quality, and Non-Conformance Reporting

A. Reliability and maintainability requirements for the TF-FGI shall be as defined in LS-71026, "Human Research Facility (HRF) Reliability Plan." (LS-71000, Section 7.2)

B. Quality Assurance for the HRF Program shall be implemented in accordance with the LS-71030, "Quality Assurance Plan for the Human Research Facility." (LS-71000, Section 7.3.1)

C. Non-Conformance Reporting

1. For flight hardware produced under a contract or subcontract at a site other than JSC, non-conformance reporting requirements shall be specified in the Statement of Work (SOW) Data Requirements List, and Data Requirement Descriptions (DRDs) shall be used to identify the submittal and data requirements. (LS-71000, Section 7.3.2.1)

2. For flight hardware developed at JSC, non-conformance reporting shall be in accordance with JPD 5335.1 and the applicable technical division plan (LS-71000, Section 7.3.2.2)

3. Non-conformances, which meet the Level 1 Problem Reporting and Corrective Action criteria for payloads as defined in SSP 30223, shall be reported in accordance with SSP 30223 (LS-71000, Section 7.3.2.3)

4. Software non-conformance reporting shall be in accordance with LS-71020-1, "Software Development Plan for the Human Research Facility." (LS-71000, Section 7.3.2.4)

3.2.3.1 Failure Propagation

The design shall preclude propagation of failures from the payload (P/L) to the environment outside the payload. (NSTS 1700.7B, Section 206)

3.2.3.2 Useful Life

The TF-FGI hardware shall be designed for a 10 year utilization. (LS-71000, Section 7.2.1) This useful life can be obtained by replacing limited life items (e.g., batteries, insoles) with Orbital Replacement Units (ORUs) and/or allowing for ground refurbishment.

3.2.4 Maintainability

A. Not applicable to the TF-FGI.

B. Not applicable to the TF-FGI.

C. Not applicable to the TF-FGI.

D. Electrical connectors and cable installations shall permit disconnection and reconnection without damage to wiring connectors. (LS-71000, Section 6.4.4.3.2C)

E. Not applicable to the TF-FGI.

F. Not applicable to the TF-FGI.

G. Not applicable to the TF-FGI.

3.2.4.1 Logistics and Maintenance

3.2.4.1.1 Payload In-Flight Maintenance

Not applicable to the TF-FGI.

3.2.4.1.2 Maintenance

The TF-FGI inflight cleanliness/maintenance will be controlled through an on-orbit operations procedure. No unscheduled on-orbit maintenance activities will be performed. The following scheduled maintenance activities will be performed:

A. Battery replacement will be performed as necessary.

3.2.5 Environmental Conditions

3.2.5.1 On-Orbit Environmental Conditions

3.2.5.1.1 On-Orbit Internal Environments

3.2.5.1.1.1 Pressure

The TF-FGI shall be safe when exposed to pressures of 0 to 104.8 kPa (0 to 15.2 psia). (LS-71000, Section 6.3.6.1.1)

3.2.5.1.1.2 Temperature

The TF-FGI shall be safe when exposed to temperatures of 10 to 46 °C (50 to 115 °F). (LS-71000, Section 6.3.6.1.2)

3.2.5.1.1.3 Humidity

Not applicable to the TF-FGI.

3.2.5.1.2 Use of Cabin Atmosphere

3.2.5.1.2.1 Active Air Exchange

Not applicable to the TF-FGI.

3.2.5.1.2.2 Oxygen Consumption

Not applicable to the TF-FGI.

3.2.5.1.2.3 Chemical Releases

Chemical releases to the cabin air shall be in accordance with paragraphs 209.1a and 209.1b in NSTS 1700.7B, ISS Addendum. (LS-71000, Section 6.3.6.2.3)

3.2.5.1.2.4 Cabin Air Heat Leak

Cabin air heat rejection is defined by the ISS program in terms of ISS modules only. No sub-allocation has been made for integrated racks or Experiment Unique Equipment (EUE). TF-FGI maximum cabin air heat rejection must be documented in the HRF Rack 1 ICD. (LS-71000, Section 6.3.4.2)

3.2.5.1.2.5 Cabin Air Cooling

Not applicable to the TF-FGI.

3.2.5.1.3 Ionizing Radiation Requirements

3.2.5.1.3.1 Instrument Contained or Generated Ionizing Radiation

Not applicable to the TF-FGI.

3.2.5.1.3.2 Ionizing Radiation Dose

The hardware should expect a total dose (including trapped protons and electrons) of 30 Rads (Si) per year of ionizing radiation. A review of the dose estimates in the ISS (SAIC-TN-9550) may show ionizing radiation exposure to be different than 30 Rads (Si) per year, if the intended location of the rack in the ISS is known. (LS-71000, Section 6.3.6.3.2)

3.2.5.1.3.3 Single Event Effect (SEE) Ionizing Radiation

The TF-FGI shall be designed not to produce an unsafe condition or one that could cause damage to equipment external to the TF-FGI as a result of exposure to SEE ionizing radiation assuming exposure levels specified in SSP 30512, paragraph 3.2.1, with a shielding thickness of 25.4 mm (1000 mils). (LS-71000, Section 6.3.6.3.3)

3.2.5.1.4 Additional Environmental Conditions

The environmental information provided in Table 3.2.5.1.4-1, Environmental Conditions on ISS, and Figure 3.2.5.1.4-1, Operating Limits of the ISS Atmospheric Total Pressure, Nitrogen and Oxygen Partial Pressures, is for design and analysis purposes. (LS-71000, Section 6.3.6.3.4)

TABLE 3.2.5.1.4-1. ENVIRONMENTAL CONDITIONS ON ISS

Environmental Condition	Value
Atmospheric Conditions	
Pressure Extremes	0 to 104.8 kPa (0 to 15.2 psia)
Normal operating pressure	See Figure 3.2.5.1.4-1
Oxygen partial pressure	See Figure 3.2.5.1.4-1
Nitrogen partial pressure	See Figure 3.2.5.1.4-1
Dewpoint	4.4 to 15.6 °C (40 to 60 °F)
Percent relative humidity	25 to 75
Carbon dioxide partial pressure during normal operations with 6 crewmembers plus animals	24-hr average exposure 5.3 mm Hg Peak exposure 7.6 mm Hg
Carbon dioxide partial pressure during crew changeout with 11 crewmembers plus animals	24-hr average exposure 7.6 mm Hg Peak exposure 10 mm Hg
Cabin air temperature in United States Lab (USL), Japanese Experiment Module (JEM), Attached Pressurized Module (APM), and Centrifuge Accommodation Module (CAM)	17 to 28 °C (63 to 82 °F)
Cabin air temperature in Node 1	17 to 31 °C (63 to 87 °F)
Air velocity	0.051 to 2.03 m/s (10 to 40 ft/min)
Airborne microbes	Less than 1000 Colony Forming Units (CFU)/m^3
Atmosphere particulate level	Average less than 100,000 particles/ft^3 for particles less than 0.5 micron in size
Mini Pressurized Logistics Module (MPLM) Air Temperatures	**Active and Passive Flights**
Extremes for all phases of flight	10 to 46 °C (50 to 114.8 °F)
Thermal Conditions	
Module wall temperature	13 °C to 43 °C (55 °F to 109 °F)
Other integrated payload racks	Front surface less than 37 °C (97 °F)
Microgravity	TBD
General Illumination	108 Lux (10 fc) measured 30 inches from the floor in the center of the aisle

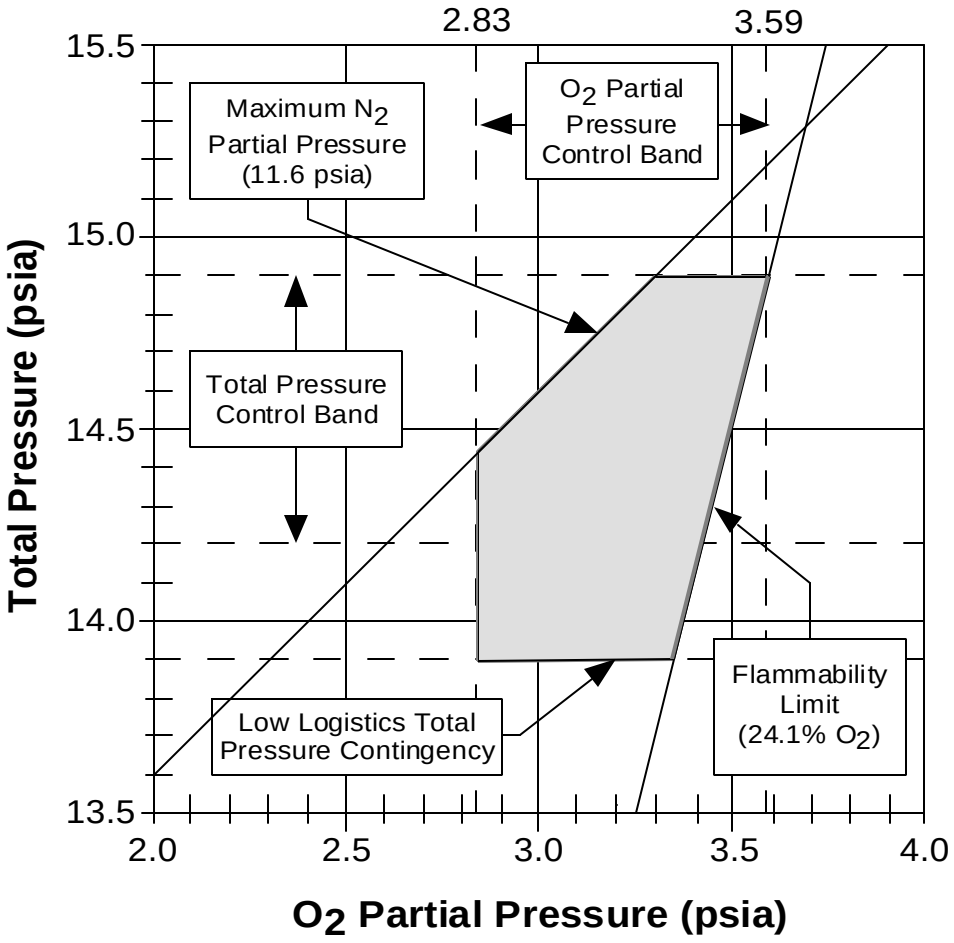

Figure 3.2.5.1.4-1. Operating Limits of the ISS Atmospheric Total Pressure, Nitrogen, and Oxygen Partial Pressures

3.2.5.1.5 Pressure Rate of Change

A. The TF-FGI shall maintain positive margins of safety for the on-orbit depress/repress rates in Table 3.2.5.1.5-1. (LS-71000, Section 6.3.1.2B)

TABLE 3.2.5.1.5-1. ISS PRESSURE RATE OF CHANGE

Depressurization	878 Pa/sec (7.64 psi/minute)
Repressurization	230 Pa/sec (2.0 psi/minute)

B. Deleted.

C. The hardware shall maintain positive margins of safety for maximum depressurization and repressurization rates for the carrier(s) in which it will be transported. (LS-71000, Section 6.3.1.2A)

(1) The hardware shall maintain positive margins of safety for maximum depressurization and repressurization rates for the Mini Pressurized Logistics Module (MPLM) documented in Table 3.2.5.1.5-2. (Derived from LS-71000, Section 6.3.1.2A)

TABLE 3.2.5.1.5-2. MPLM PRESSURE RATE OF CHANGE

Depressurization	890 Pa/sec (7.75 psi/minute)
Repressurization	800 Pa/sec (6.96 psi/minute)

(2) The hardware shall maintain positive margins of safety for maximum depressurization and repressurization rates for the Orbiter Middeck documented in Table 3.2.5.1.5-3.

TABLE 3.2.5.1.5-3. ORBITER MIDDECK PRESSURE RATE OF CHANGE

Depressurization/Repressurization	1031 Pa/sec (9.0 psi/minute)

D. Not applicable to the TF-FGI.

3.2.5.2 Acoustic Emission Limits

Not applicable to the TF-FGI.

3.2.5.3 Instrument Surface Temperature

Not applicable to the TF-FGI.

3.2.6 Transportability

3.2.6.1 Launch and Landing

The TF-FGI shall be transportable to and from orbit. Equipment carried in the Shuttle middeck lockers shall be transportable in the Shuttle middeck locker to and from orbit, as specified in NSTS-21000-IDD-MDK.

3.2.7 Operational Interface Requirements

3.2.7.1 Mechanical Interface Requirements

The TF-FGI shall be stowed for launch and transport to the ISS. It requires no shuttle services or interfaces. For calibration, the TF-FGI shall interface with the FGI Flight Calibration Unit, P/N SEG33110402-301, as shown in Figure 3.2.7.1-1. For data collection, the TF-FGI shall be supported by the LEMS.

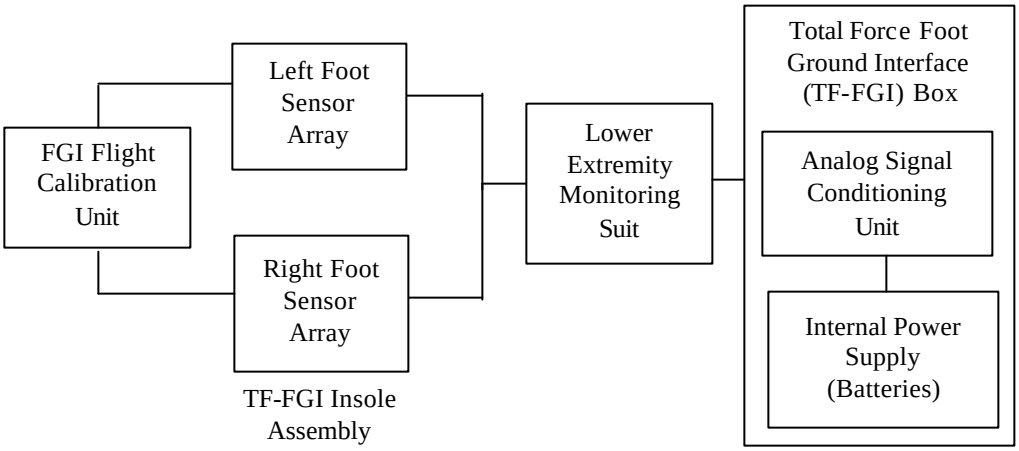

Figure 3.2.7.1-1. TF-FGI Mechanical Interface Diagram

3.2.7.1.1 Connector Physical Mate

Not applicable to the TF-FGI.

3.2.7.2 Electrical Interface Requirements

The TF-FGI shall interface electrically with the LEMS and the ADAS as shown in Figure 3.2.7.2-1. The TF-FGI shall have no external power interfaces. A 9V battery shall power the hardware.

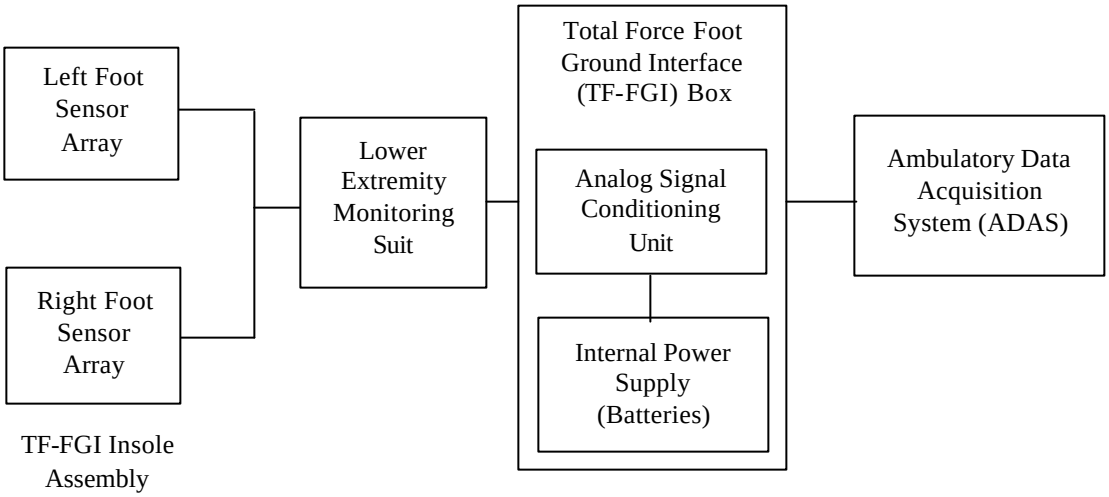

Figure 3.2.7.2-1. TF-FGI Electrical Interface Diagram

3.2.7.2.1 Electromagnetic Radiation

3.2.7.2.1.1 Electromagnetic Compatibility (EMC)

Not applicable to the TF-FGI.

3.2.7.2.1.1.1 Electrical Grounding

Not applicable to the TF-FGI.

3.2.7.2.1.1.2 Electrical Bonding

Not applicable to the TF-FGI.

3.2.7.2.1.2 Electromagnetic Interference

A. The TF-FGI shall meet all Electromagnetic Interference (EMI) requirements of SSP 30237. (LS-71000, Section 6.3.2.4.4)

B. Alternately, the payload Electrical Power Consuming Equipment (EPCE) may choose to accept a minimal increase of EMI risk with a somewhat less stringent Electric Field Radiated Susceptibility (RS03) requirement on equipment considered to be non-safety critical to the vehicle and crew. The tailored RS03 requirement, shown below, will hereafter be denoted RS03PL. (LS-71000, Section 6.3.2.4.4)

TABLE 3.2.7.2.1.2-1. RS03PL

FREQUENCY	RS03PL LIMIT (V/m)
14 KHz - 400 MHz	5
400 MHz - 450 MHz	30
450 MHz - 1 GHz	5
1 GHz - 5 GHz	25
5 GHz - 6 GHz	60
6 GHz - 10 GHz	20
13.7 GHz - 15.2 GHz	25

Comments: The less stringent RS03PL limit was developed to envelope the electric fields generated by ISS transmitters and ground-based radars tasked to perform space surveillance and tracking. Ground-based radars that are not tasked to track the ISS and search radars that could momentarily sweep over the ISS are not enveloped by the relaxed RS03PL. For most scientific payloads, the minimal increase of EMI risk for the reduced limits is acceptable. The RS03PL limit does not account for module electric field shielding effectiveness that could theoretically reduce the limits even more. Although shielding effectiveness exists, it is highly dependent on the EPCE location within the module with respect to ISS windows.

3.2.7.2.2 Electrostatic Discharge

A. Unpowered TF-FGI EPCE shall not be damaged by Electrostatic Discharge (ESD) equal to or less than 4000 V to the case or any pin on external connectors. (LS-71000, Section 6.3.2.5)

B. TF-FGI EPCE that may be damaged by ESD between 4000 V and 15,000 V shall have a label affixed to the case in a location clearly visible in the installed position. (LS-71000, Section 6.3.2.5)

C. Labeling of TF-FGI EPCE susceptible to ESD up to 15,000 V shall be in accordance with MIL-STD-1686. (LS-71000, Section 6.3.2.5)

NOTE: These voltages are the result of charges that may be accumulated and discharged from ground personnel or crewmembers during equipment installation or removal. (LS-71000, Section 6.3.2.5)

3.2.7.2.3 Corona

The TF-FGI shall be designed to preclude damaging or destructive corona in its operating environment. Guidance for meeting the corona requirement is found in MSFC-STD-531, High Voltage Design Criteria. Per MIL-STD-531, corona is a luminous discharge due to the ionization of the gas surrounding a conductor around which exists a voltage gradient exceeding a certain critical value. (LS-71000, Section 6.3.2.8)

3.2.7.2.4 Cable/Wire Design and Control Requirements

Not applicable to the TF-FGI.

3.2.7.2.4.1 Wire Derating

A. Not applicable to the TF-FGI.

B. Not applicable to the TF-FGI.

3.2.7.2.4.2 Exclusive Power Feeds

Not applicable to the TF-FGI.

3.2.7.2.5 Loss of Power

Not applicable to the TF-FGI.

3.2.7.2.6 Alternating Current Magnetic Fields

The generated Alternating Current (AC) magnetic fields, measured at a distance of 7 centimeters (cm) from the generating equipment, shall not exceed 140 dB above 1 picotesla for frequencies ranging from 30 Hz to 2 KHz, then falling 40 dB per decade to 50 KHz. (LS-71000, Section 6.3.2.6)

3.2.7.2.7 Direct Current Magnetic Fields

The generated Direct Current (DC) magnetic fields shall not exceed 170 dB picotesla at a distance of 7 cm from the generating equipment. This applies to electromagnetic and permanent magnetic devices. (LS-71000, Section 6.3.2.7)

3.2.7.3 Command and Data Handling Interface Requirements

Not applicable to the TF-FGI.

3.2.7.4 Fire Protection Interface Requirements

Fire detection requirements for instruments operated outside of rack volumes have not been defined by ISS. Fire detection methodology for instruments operated outside of rack volumes must be approved by the PSRP. Fire protection requirements in this section apply to all instruments. Fire suppression requirements in this section apply to instruments operated outside of the rack volume that have forced air flow. (LS-71000, Section 6.3.7)

3.2.7.4.1 Fire Prevention

The TF-FGI shall meet the fire prevention requirements specified in NSTS 1700.7B, ISS Addendum, paragraph 220.10a. (LS-71000, Section 6.3.7.1)

NOTE: Reference in SSP 57000C and LS 71000A to 220.10a is an error. The reference should be to 220.10.

3.2.7.4.2 Fire Suppression

Not applicable to the TF-FGI.

3.2.7.4.3 Labeling

Not applicable to the TF-FGI.

3.2.7.5 Other Interface Requirements

Not applicable to the TF-FGI.

3.3 DESIGN AND CONSTRUCTION

3.3.1 Materials, Processes, and Parts

3.3.1.1 Materials and Processes

A. The TF-FGI shall use materials and parts that meet the materials requirements specified in NSTS 1700.7B, ISS Addendum, Section 209. (LS-71000, Section 6.3.8.1)

B. Commercial Off-the-Shelf (COTS) parts used in the TF-FGI shall meet the materials requirements specified in NSTS 1700.7B, ISS Addendum, Section 209. (LS-71000, Section 6.3.8.2)

C. The TF-FGI shall conform to Visibly Clean-Sensitive (VC-S) requirements as specified in SN-C-0005. (LS-71000, Section 6.3.8.3)

D. Not applicable to the TF-FGI.

E. HRF instruments that are intended to remain on-orbit for more than one year shall use fungus resistant materials according to the requirements specified in SSP 30233, paragraph 4.2.10. (LS-71000, Section 6.3.8.4)

3.3.1.2 Sharp Edges and Corner Protection

The TF-FGI design within a pressurized module shall protect crewmembers from sharp edges and corners during all crew operations in accordance with NSTS 1700.7B, ISS Addendum, paragraph 222.1. (LS-71000, Section 6.4.9.2)

3.3.1.3 Holes

Not applicable to the TF-FGI.

3.3.1.4 Latches

Not applicable to the TF-FGI.

3.3.1.5 Screws and Bolts

Threaded ends of screws and bolts accessible by the crew and extending more than 3.0 mm (0.12 in) shall be capped to protect against sharp threads. (LS-71000, Section 6.4.9.5)

3.3.1.6 Securing Pins

Not applicable to the TF-FGI.

3.3.1.7 Levers, Cranks, Hooks, and Controls

Not applicable to the TF-FGI.

3.3.1.8 Burrs

Exposed surfaces shall be free of burrs. (LS-71000, Section 6.4.9.8)

3.3.1.9 Locking Wires

Not applicable to the TF-FGI.

3.3.2 Nameplates and Product Marking

3.3.2.1 Equipment Identification

Integrated racks, all (installed in the rack or separately) sub-rack elements, loose equipment, stowage trays, consumables, ORUs, crew accessible connectors and cables, switches, indicators, and controls shall be labeled. Labels are markings of any form [including Inventory Management System (IMS) bar codes] such as decals and placards, which can be adhered, "silk screened," engraved, or otherwise applied directly onto the hardware. Appendix C of SSP 57000C provides instructions for label and decal design and approval. (LS-71000, Section 6.4.7)

3.3.3 Workmanship

Workmanship shall be in accordance with approved NASA and industry recognized standards.

3.3.4 Interchangeability

Interchangeability requirements are not applicable to detail parts of permanent assemblies such as welded assemblies or matched detailed parts such as lapped components. Interchangeability requirements do not apply to custom-fitted or custom-sized items.

All replaceable parts or assemblies having the same part number shall be directly and completely interchangeable with each other, with respect to form, fit and function.

3.3.5 Safety Requirements

3.3.5.1 Electrical Safety

3.3.5.1.1 Mating/Demating of Powered Connectors

The TF-FGI shall comply with the requirements for mating/demating of powered connectors specified in NSTS 18798, MA2-97-093. (LS-71000, Section 6.3.2.10.1)

NOTE: The HRF rack or Utility Outlet Panel (UOP) can provide one verifiable upstream inhibit which removes voltage from the Utility Interface Panel (UIP) and UOP connectors. The module design will provide the verification of the inhibit status at the time the inhibit is inserted. (Derived from LS-71000, Section 6.3.2.10.1)

3.3.5.1.2 Power Switches/Controls

A. Not applicable to the TF-FGI.

B. Not applicable to the TF-FGI.

C. Not applicable to the TF-FGI.

3.3.5.1.3 Ground Fault Circuit Interrupters/Portable Equipment DC Sourcing Voltage

A-G Not applicable to the TF-FGI.

3.3.5.1.4 Portable Equipment/Power Cords

A-B Not applicable to the TF-FGI.

3.3.6 Human Engineering

3.3.6.1 Closures or Covers Design Requirements

Closures or covers shall be provided for any area of the payload that is not designed for routine cleaning. (LS-71000, Section 6.4.3.1.1)

3.3.6.2 Interior Color

3.3.6.2.1 Rack Mounted Equipment

A-C Not applicable to the TF-FGI.

3.3.6.2.2 Stowed/Deployable Equipment

The colors and finishes for stowed and deployable equipment, even if it is normally attached to the rack during use, shall be as specified below:

A. COTS equipment that is not repackaged by HRF engineers shall be finished as delivered by the manufacturer. (LS-71000, Section 6.4.3.5.2A)

B. Items that are repackaged by HRF engineers shall be finished using anodic film per MIL-A-8625, Type II, Class 2, Dyed Turquoise. Reference FED-STD-595, Color Specification 15187. (LS-71000, Section 6.4.3.5.2B)

3.3.6.2.3 Colors for Soft Goods

NOTE: Human factors engineering will provide guidance in the appropriate colors for soft goods in cooperation with the lead engineers who will provide data on the available color choices for the specified materials.

3.3.6.3 Full Size Range Accommodation

A. All payload workstations and hardware having crew nominal operations and planned maintenance shall be sized to meet the functional reach limits for the 5th percentile Japanese female and yet shall not constrict or confine the body envelope for the 95th percentile American male as specified in SSP 50005, Section 3. (LS-71000, Section 6.4.2.3)

B. COTS equipment shall be as delivered by the manufacturer and is exempt from this requirement.

3.3.6.4 Operation and Control of Payload Equipment

A. Grip Strength

To remove, replace, and operate payload hardware, grip strength required shall be less than 254 N (57 lbf). (LS-71000, Section 6.4.1.1A)

B. Linear Forces

Linear forces required to operate or control payload hardware or equipment shall be less than the strength values for the 5th percentile female, defined as 50% of the strength values shown in Figure 3.3.6.4-1 and 60% of the strength values shown in Figure 3.3.6.4-2. (LS-71000, Section 6.4.1.1B)

C. Torque

Torque required to operate or control payload hardware or equipment shall be less than the strength values for the 5th percentile female, defined as 60% of the calculated 5th percentile male capability shown in Figure 3.3.6.4-3. (LS-71000, Section 6.4.1.1C)

3.3.6.5 Maintenance Operations

Not applicable to the TF-FGI.

3.3.6.6 Adequate Clearance

Not applicable to the TF-FGI.

3.3.6.7 Accessibility

A. Payload hardware shall be geometrically arranged to provide physical and visual access for all payload installation, operations, and maintenance tasks. Payload ORUs should be removable along a straight path until they have cleared the surrounding structure. (LS-71000, Section 6.4.2.2A)

B. Intravehicular Activity (IVA) clearances for finger access shall be provided as given in Figure 3.3.6.7-1. (LS-71000, Section 6.4.2.2B)

Figure 3.3.6.7-1. Minimum Sizes for Access Openings for Fingers

3.3.6.8 One-Handed Operation

Not applicable to the TF-FGI.

3.3.6.9 Continuous/Incidental Contact - High Temperature

When payload surfaces whose temperature exceeds 49 °C (120 °F), which are subject to continuous or incidental contact, are exposed to crewmember's bare skin contact, protective equipment shall be provided to the crew and warning labels shall be provided at the surface site. This also applies to surfaces not normally exposed to the cabin in accordance with the NASA IVA Touch Temperature Safety interpretation letter JSC, MA2–95–048. (LS-71000, Section 6.4.3.2.1)

3.3.6.10 Continuous/Incidental Contact – Low Temperature

Not applicable to the TF-FGI.

3.3.6.11 Equipment Mounting

Equipment items used during nominal operations and planned maintenance shall be designed, labeled, or marked to protect against improper installation. (LS-71000, Section 6.4.4.2.1)

3.3.6.12 Drawers and Hinged Panels

A-B Not applicable to the TF-FGI.

3.3.6.13 Alignment

Not applicable to the TF-FGI.

3.3.6.14 Push-Pull Force

Not applicable to the TF-FGI.

3.3.6.15 Covers

Where physical access is required, one of the following practices shall be followed, with the order of preference given.

A. Provide a sliding or hinged cap or door where debris, moisture, or other foreign materials might otherwise create a problem. (LS-71000, Section 6.4.4.2.6.1A)

B. Provide a quick-opening cover plate if a cap will not meet stress requirements. (LS-71000, Section 6.4.4.2.6.1B)

3.3.6.16 Self-Supporting Covers

All access covers that are not completely removable shall be self-supporting in the open position. (LS-71000, Section 6.4.4.2.6.2)

3.3.6.17 Accessibility

It shall be possible to mate/demate individual connectors without having to remove or mate/demate other connectors during nominal operations. (LS-71000, Section 6.4.4.3.2A)

3.3.6.18 Ease of Disconnect

Electrical connectors shall require no more than two turns to disconnect. (LS-71000, Section 6.4.4.3.3)

3.3.6.19 Self Locking

Payload electrical connectors shall provide a self-locking feature. (LS-71000, Section 6.4.4.3.5)

3.3.6.20 Connector Arrangement

A. Space between connectors and adjacent obstructions shall be a minimum of 25 mm (1 inch) for IVA access. (LS-71000, Section 6.4.4.3.6A)

B. Connectors in a single row or staggered rows which are removed sequentially by the crew IVA shall provide 25 mm (1 inch) of clearance from other connectors and/or adjacent obstructions for 270 degrees of sweep around each connector beginning at the start of its removal/replacement sequence. (LS-71000, Section 6.4.4.3.6B)

3.3.6.21 Arc Containment

Electrical connector plugs shall be designed to confine/isolate the mate/demate electrical arcs or sparks. (LS-71000, Section 6.4.4.3.7)

3.3.6.22 Connector Protection

Protection shall be provided for all demated connectors against physical damage and contamination. (LS-71000, Section 6.4.4.3.8)

3.3.6.23 Connector Shape

Payload connectors shall use different connector shapes, sizes, or keying to prevent mating connectors when lines differ in content. (LS-71000, Section 6.4.4.3.9)

3.3.6.24 Alignment Marks or Guide Pins

Mating parts shall have alignment marks in a visible location during mating or guide pins (or their equivalent). (LS-71000, Section 6.4.4.3.11A)

3.3.6.25 Coding

A. Both halves of mating connectors shall display a code or identifier that is unique to that connection. (LS-71000, Section 6.4.4.3.12A)

B. The labels or codes on connectors shall be located so they are visible when connected or disconnected. (LS-71000, Section 6.4.4.3.12B)

3.3.6.26 Pin Identification

Each pin shall be uniquely identifiable in each electrical plug and each electrical receptacle. At least every 10th pin must be labeled. (LS-71000, Section 6.4.4.3.13)

3.3.6.27 Orientation

Grouped plugs and receptacles shall be oriented so that the aligning pins or equivalent devices are in the same relative position. (LS-71000, Section 6.4.4.3.14)

3.3.6.28 Hose/Cable Restraints

A-D Not applicable to the TF-FGI.

3.3.6.29 Non-Threaded Fasteners Status Indication

Not applicable to the TF-FGI.

3.3.6.30 Mounting Bolt/Fastener Spacing

Not applicable to the TF-FGI.

3.3.6.31 Multiple Fasteners

When several fasteners are used on one item they shall be of identical type. (LS-71000, Section 6.4.4.4.3)

NOTE: Phillips or Torque-Set fasteners may be used where fastener installation is permanent relative to planned on-orbit operations or maintenance, or where tool-fastener interface failure can be corrected by replacement of the unit containing the affected fastener with a spare unit.

3.3.6.32 Captive Fasteners

Not applicable to the TF-FGI.

3.3.6.33 Quick Release Fasteners

A-B Not applicable to the TF-FGI.

3.3.6.34 Threaded Fasteners

Not applicable to the TF-FGI.

3.3.6.35 Over Center Latches

A-C Not applicable to the TF-FGI.

3.3.6.36 Winghead Fasteners

Not applicable to the TF-FGI.

3.3.6.37 Fastener Head Type

A. Not applicable to the TF-FGI.

B. If a smooth surface is required, flush or oval head internal hex grip fasteners shall be used for fastening. (LS-71000, Section 6.4.4.4.9B)

C. Not applicable to the TF-FGI.

3.3.6.38 One-Handed Actuation

Not applicable to the TF-FGI.

3.3.6.39 Accessibility

Not applicable to the TF-FGI.

3.3.6.40 Access Holes

Not applicable to the TF-FGI.

3.3.6.41 Controls Spacing Design Requirements

All spacing between controls and adjacent obstructions shall meet the minimum requirements as shown in Figure 3.3.6.41-1, Control Spacing Requirements for Ungloved Operation. (LS-71000, Section 6.4.4.5.1)

3.3.6.42 Protective Methods

Payloads shall provide protection against accidental control actuation using one or more of the protective methods listed in subparagraphs A through G below. Infrequently used controls (i.e., those used for calibration) should be separated from frequently used controls. Leverlock switches or switch covers are strongly recommended for switches related to mission success. Switch guards may not be sufficient to prevent accidental actuation.

A. Locate and orient the controls so that the operator is not likely to strike or move them accidentally in the normal sequence of control movements. (LS-71000, Section 6.4.5.2.1A)

B. Recess, shield, or otherwise surround the controls by physical barriers. The control shall be entirely contained within the envelope described by the recess or barrier. (LS-71000, Section 6.4.5.2.1B)

C. Cover or guard the controls. Safety or lock wire shall not be used. (LS-71000, Section 6.4.5.2.1C)

D. Cover guards when open shall not cover or obscure the protected control or adjacent controls. (LS-71000, Section 6.4.5.2.1D)

E. Provide the controls with interlocks so that extra movement (e.g., lifting switch out of a locked detent position) or the prior operation of a related or locking control is required. (LS-71000, Section 6.4.5.2.1E)

F. Provide the controls with resistance (i.e., viscous or coulomb friction, spring-loading, or inertia) so that definite or sustained effort is required for actuation. (LS-71000, Section 6.4.5.2.1F)

G. Provide the controls with a lock to prevent the control from passing through a position without delay when strict sequential actuation is necessary (i.e., the control moved only to the next position, then delayed). (LS-71000, Section 6.4.5.2.1G)

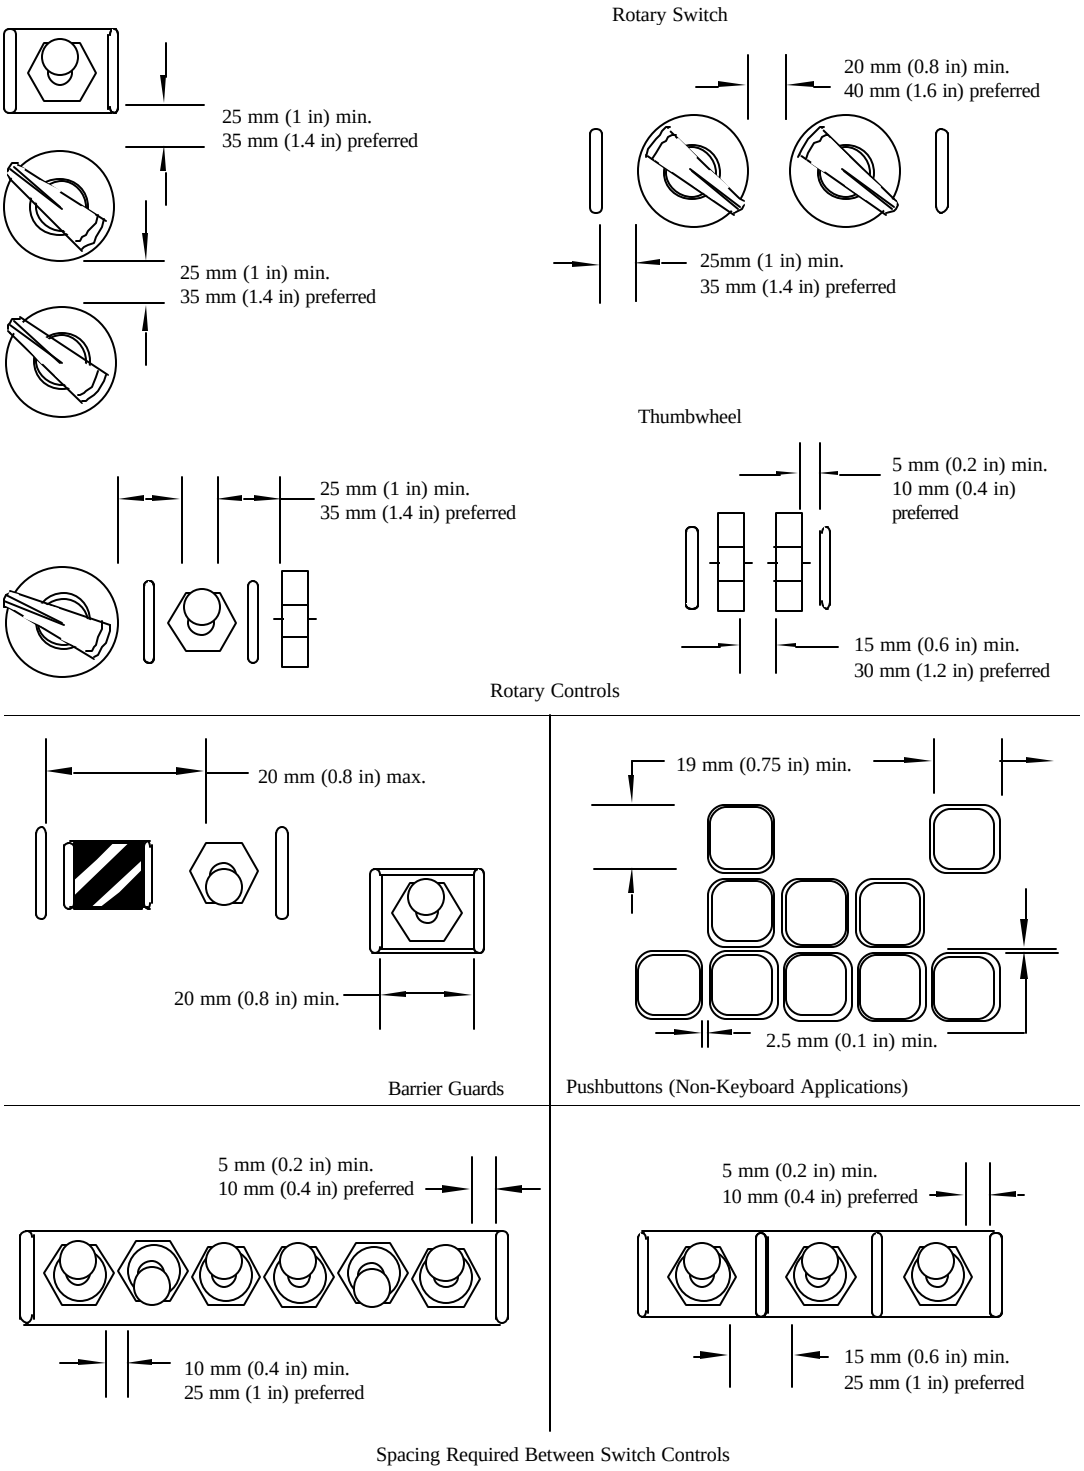

Figure 3.3.6.41-1. Control Spacing Requirements for Ungloved Operation

NOTE: Displays and controls used only for maintenance and adjustments, which could disrupt normal operations if activated, should be protected during normal operations, e.g., by being located separately or guarded/covered.

3.3.6.43 Noninterference

Payload provided protective devices shall not cover or obscure other displays or controls. (LS-71000, Section 6.4.5.2.2)

3.3.6.44 Dead-Man Controls

Not applicable to the TF-FGI.

3.3.6.45 Barrier Guards

Not applicable to the TF-FGI.

3.3.6.46 Recessed Switch Protection

Not applicable to the TF-FGI.

3.3.6.47 Position Indication

Not applicable to the TF-FGI.

3.3.6.48 Hidden Controls

Not applicable to the TF-FGI.

3.3.6.49 Hand Controllers

Not applicable to the TF-FGI.

3.3.6.50 Valve Controls

A-E Not applicable to the TF-FGI.

3.3.6.51 Toggle Switches

Not applicable to the TF-FGI.

3.3.6.52 Stowage Drawer Contents Restraints

A-C Not applicable to the TF-FGI.

3.3.6.53 Deleted.

3.3.6.54 Captive Parts

Payloads and payload equipment shall be designed in such a manner to ensure that all unrestrained parts (e.g., locking pins, knobs, handles, lens covers, access plates, or similar devices) that may be temporarily removed on orbit will be tethered or otherwise held captive.

3.3.6.55 Handles and Restraints

Not applicable to the TF-FGI.

3.3.6.56 Handle Location/Front Access

Not applicable to the TF-FGI.

3.3.6.57 Handle Dimensions

Not applicable to the TF-FGI.

3.3.6.58 Non-Fixed Handles Design Requirements

A-C Not applicable to the TF-FGI.

3.3.6.59 Electrical Hazards

A-E Not applicable to the TF-FGI.

3.3.6.60 Mismatched

A. The design of electrical connectors shall make it impossible to inadvertently reverse a connection or mate the wrong connectors if a hazardous condition can be created. (LS-71000, Section 6.4.9.1.1A)

B. Payload and on-orbit support equipment, wire harnesses, and connectors shall be designed such that no blind connections or disconnections must be made during payload installation, operation, removal, or maintenance on orbit unless the design includes scoop proof connectors or other protective features (NSTS 1700.7B, ISS Addendum, paragraph 221). (LS-71000, Section 6.4.9.1.1B)

C. For payload equipment, for which mismating or cross-connection may damage ISS-provided equipment, plugs, and receptacles (connectors), shall be selected and applied such that they cannot be mismatched or cross-connected in the intended system as well as adjacent systems. Although identification markings or labels are required, the use of identification alone is not sufficient to preclude mismating. (LS-71000, Section 6.4.9.1.1C)

D. For all other payload connections, combinations of identification, keying and clocking, and equipment test and checkout procedures shall be employed at the payload's discretion to minimize equipment risk while maximizing on-orbit operability. (LS-71000, Section 6.4.9.1.1D)

3.3.6.61 Device Accessibility

An overload protective device shall not be accessible without opening a door or cover, except that an operating handle or button of a circuit breaker, the cap of an extractor-type fuse holder, and similar parts may project outside the enclosure. (LS-71000, Section 6.4.9.1.2.1)

3.3.6.62 Extractor –Type Fuse Holder

Not applicable.

3.3.6.63 Overload Protection Location

Not applicable.

3.3.6.64 Overload Protection Identification

Not applicable.

3.3.6.65 Automatic Restart Protection

The TF-FGI will take exception to the following requirement:

Controls shall be employed that prevent automatic restarting after an overload-initiated shutdown. (LS-71000, Section 6.4.9.1.2.5)

3.3.6.66 Audio Devices (Displays)

A-C Not applicable to the TF-FGI.

3.3.6.67 Egress

All payload egress requirements shall be in accordance with NSTS 1700.7B, ISS Addendum, paragraph 205. (LS-71000, Section 6.4.9.11)

3.3.6.68 Restraints and Mobility Aids

The TF-FGI shall be designed such that all installation, operation, and maintenance can be performed using standard crew restraints, mobility aids, and interfaces as defined in SSP 30257:004.

3.3.7 System Security

Not Applicable to the TF-FGI.

3.3.8 Design Requirements

3.3.8.1 Structural Design Requirements

A. The hardware shall maintain positive margins of safety for launch and landing loading conditions for the carrier(s) in which it will be transported:

(1) MPLM Launch and Landing Loading - based upon acceleration environment as defined in SSP 41017 Part 1, paragraph 3.2.1.4.2. (LS-71000, Section 6.3.1.3A)

(2) Orbiter Middeck Launch and Landing Loading - based upon acceleration environment as defined in NSTS-21000-IDD-MDK, Table 4.1-1. (LS-71000, Section 6.3.1.3A)

B. The hardware shall provide positive margins of safety for on-orbit loads of 0.2 Gs acting in any direction. (LS-71000, Section 6.3.1.3B)

3.3.8.1.1 Crew-Induced Load Requirements

The hardware shall provide positive margins of safety when exposed to the crew-induced loads defined in Table 3.3.8.1.1-1, Crew-Induced Loads. (LS-71000, Section 6.3.1.3C)

TABLE 3.3.8.1.1-1. CREW-INDUCED LOADS

Crew System or Structure	Type of Load	Load	Direction of Load
Levers, Handles, Operating Wheels, Controls	Push or Pull concentrated on most extreme edge	222.6 N (50 lbf), limit	Any direction
Small Knobs	Twist (torsion)	14.9 N-M (11 ft-lbf), limit	Either direction
Exposed Utility Lines (Gas, Fluid, and Vacuum)	Push or Pull	222.6 N (50 lbf)	Any direction
Cabinets and any normally exposed equipment	Load distributed over a 4-inch by 4-inch area	556.4 N (125 lbf), limit	Any direction
Legend: ft = feet, m = meter, N = Newton, lbf = pounds force			

3.3.8.1.2 Safety Critical Structures Requirements

Not applicable to the TF-FGI.

3.3.8.2 Electrical Power Consuming Equipment Design

3.3.8.2.1 Batteries

All battery systems shall meet the requirements of NSTS 1700.7B, ISS addendum, Section 213.2. (Derived from LS-71000, Section 6.3.2.10)

3.3.8.3 Pressurized Gas Bottle Design

Not applicable to the TF-FGI.

3.4 ACCEPTANCE AND QUALIFICATION REQUIREMENTS

3.4.1 Nominal Operation Under Thermal Environment

The TF-FGI shall operate in accordance with the work authorizing document under the thermal environment described in 3.2.5.1.

3.4.2 Workmanship Vibration

The TF-FGI shall operate in accordance with the work authorizing document following vibration at workmanship loads.

3.4.3 Functional Performance

The TF-FGI shall operate in accordance with the work authorizing document under all planned modes of operation.

3.4.4 Electrical, Electronic, and Electromechanical Parts Control, Selection, and Burn-In

A. Parts control shall be in accordance with:

(1) NHB 5300.4(1F), "Electrical, Electronic, and Electromechanical (EEE) Parts Management and Control Requirements for NASA Space Flight Programs."

(2) SSP 30312, "Electrical, Electronic, and Electromechanical (EEE) and Mechanical Parts Management and Implementation Plan for Space Station Program."

B. Parts selection for equipment shall be in accordance with:

(1) SSP-30423, "Space Station Approved Electrical, Electronic, and Electromechanical (EEE) Parts List."

(2) SSQ-25002, "Supplemental List of Qualified Electrical, Electronic, Electromechanical (EEE) Parts, Manufacturers, and Laboratories (QEPM&L)."

(3) Semiconductors shall be JANTXV in accordance with MIL-S-19500, "General Specifications for Semiconductor Devices." Diodes shall have a metallurgical bond. Passive parts shall be at least the second highest level of appropriate Military Established Reliability (MIL-ER).

(4) SSP-30512C, "Space Station Ionizing Radiation Design Environment."

Where no alternative is available, nonmilitary parts, components, and subassemblies may be used, but burn-in screening of these items shall be performed per 3.4.4.C.

C. Burn-in screening shall be completed (100%) on all flight hardware (units).

3.4.5 Flammability

The TF-FGI shall meet the flammability test requirements as described in 4.3.5.

3.4.6 Offgassing

The TF-FGI located in inhabitable areas shall meet the offgassing test requirements as described in 4.3.6.

3.4.7 Bench Handling

The TF-FGI shall meet the requirements as described in 4.3.7.

3.4.8 Payload Mass

The TF-FGI shall meet the payload mass control requirements as described in 4.3.8.

3.4.9 Electromagnetic Compatibility

All TF-FGI equipment shall meet the EMC control requirements as described in 4.3.9.

3.4.10 Acoustic Noise

Not applicable to the TF-FGI.

3.4.11 Pre-Delivery Acceptance

All TF-FGI shall meet the pre-delivery acceptance requirements as described in 4.3.11.

3.5 HUMAN RESEARCH FACILITY PROGRAM REQUIREMENTS

3.5.1 Safety

The TF-FGI shall meet the applicable requirements of NSTS 1700.7, NSTS 1700.7 ISS Addendum, NSTS/ISS 18798, NSTS/ISS 13830, and KHB 1700.7.

3.5.2 Experiment Document

Not applicable to the TF-FGI.

3.5.3 Documentation Requirements

Documentation requirements for the TF-FGI shall be as specified in Appendix A of the Program Requirements Document (PRD) for HRF, LS-71000.

3.5.3.1 Acceptance Data Package

The contents of the Acceptance Data Package (ADP) shall meet the intent of SSP 30695, Acceptance Data Package Requirements Specification.

3.5.3.1.1 ADP Statement in SOW

The SOW for procured flight items shall contain a DRD specifying the above ADP contents.

4.0 VERIFICATION PROVISIONS

This section contains the required verification methods for ISS interface certification, science functional acceptance, and program qualification and acceptance. Section 4.1 addresses definitions for terms used herein.

Appendix B contains the applicability matrix for the ISS Pressurized Payload Interface Requirements Document. The Verification Data Sheet addressing the appropriate method for ISS interface verification is also contained in Appendix B. If an alternate verification method is desired, the new verification method must be negotiated in the Unique Payload Verification Plan.

Section 4.2 contains the verification methods for science functional acceptance. Appendix C contains the applicability matrix for science functional requirements.

Section 4.3 contains the verification methods for program qualification and acceptance requirements. Appendix D contains the applicability matrices for acceptance and qualification requirements.

The responsibility for the performance of all verification activities is as specified in Appendices B, C, and D. All testing described in Appendices B, C, and D shall be documented via Task Performance Sheet (TPS) (JSC Form 1225) per JSC Work Instruction NT1-CWI-001. Except as otherwise specified in the contract, providers may use their own or any other facility suitable for the performance of the verification requirements specified herein, unless disapproved by the Government. The Government reserves the right to perform any of the verifications set forth in this specification.

4.1 GENERAL

Equipment verification methods are defined as follows:

A. Inspection is a method that determines conformance to requirements by the review of drawings or data or by visual examination of the item using standard quality control methods, without the use of special laboratory procedures.

B. Analysis is a process used in lieu of, or in addition to, other methods to ensure compliance to specification requirements. The selected techniques may include, but not be limited to, engineering analysis, statistics and qualitative analysis, computer and hardware simulations, and analog modeling. Analysis may also include assessing the results of lower level qualification activity. Analysis may be used when it can be determined that (1) rigorous and accurate analysis is possible, (2) test is not cost effective, and (3) verification by inspection is not adequate.

C. Verification by similarity is the process of analyzing the specification criteria for hardware configuration and application for an article to determine if it is similar or identical in design, manufacturing process, and quality control to an existing article that has previously been qualified to equivalent or more stringent specification criteria. Special effort will be made to avoid duplication of previous tests from this or similar programs. If the previous application is considered to be similar, but not equal to or greater in severity, additional qualification tests shall concentrate on the areas of new or increased requirements.

D. Demonstration consists of a qualitative determination of the properties of a test article. This qualitative determination is made through observation, with or without special test equipment or instrumentation, which verifies characteristics such as human engineering features, services, access features, and transportability. Demonstration requirements are normally implemented within a test plan, operations plan, or test procedure.

E. Test is a method in which technical means, such as the use of special equipment, instrumentation, simulation techniques, and the application of established principles and procedures, are used for the evaluation of components, subsystems, and systems to determine compliance with requirements. Test shall be selected as the primary method when analytical techniques do not produce adequate results; failure modes exist which could compromise personnel safety, adversely affect flight systems or payload operation, or result in a loss of mission objectives; or for any components directly associated with Space Station and orbiter interfaces. The analysis of data derived from tests is an integral part of the test program, and should not be confused with analysis as defined above.

4.2 FUNCTIONAL PERFORMANCE ACCEPTANCE TESTING

The requirements herein describe specific test requirements for functional performance acceptance. The Principal Investigator (PI) will evaluate the data resulting from the science-related functional performance acceptance tests for confirmation of proper functionality.

The functional performance requirements specified in Section 3.2.1.1 shall be verified by one or more of the following methods: demonstration, test, analysis and inspection.

4.3 ACCEPTANCE AND QUALIFICATION VERIFICATION METHODS

The requirements herein describe specific test requirements for Total Force Foot Ground Interface (TF-FGI) acceptance and qualification. Qualification testing shall only be performed if qualification articles exist for the hardware. If no qualification articles exist for the hardware, analysis shall be used to qualify the hardware.

Qualification testing will be performed on the TF-FGI qualification unit.

4.3.1 Thermal Cycle Tests

HRF payloads undergoing thermal cycle testing shall be functionally tested at each stable temperature and during transitions. The pass-fail criteria for the functional test and the definition of the functional test will be equipment unique and shall be defined in the test plan and test procedure. Functional tests shall be conducted on end items prior to, during, and after environmental exposure. (LS-71000, Section 5.4.1.1.6)

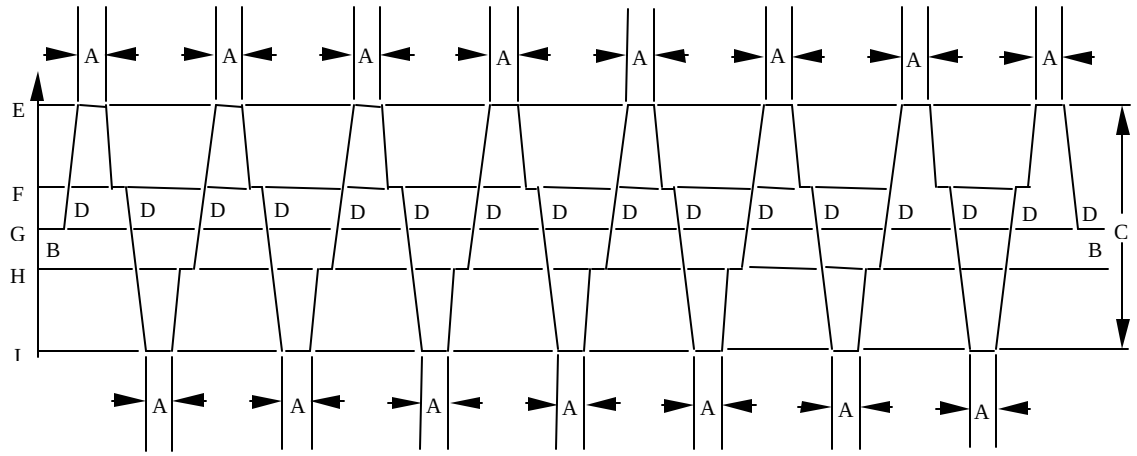
4.3.1.1 Qualification Thermal Cycling

The Qualification Thermal Cycle Test shall be conducted over a temperature range of 110 °F (61.1 °C) centered about the normal operating temperature as defined in the individual test plans. The Qualification Thermal Test (QTT) shall consist of 7½ cycles. One cycle is defined as starting from normal operating temperature, increasing to the maximum high temperature, decreasing to the minimum low temperature, and then returning to the normal operating temperature as depicted in Figure 4.3.1.1-1. The complete test is seven and one-half (7½) cycles with one-hour soaks at each extreme. The hardware will be functionally tested during transitions and at the highest and lowest temperature extremes, consistent with the defined operating temperature range. The hardware shall not be functionally tested at temperatures in excess of the defined operating temperature range. (Hardware shall be unpowered when outside the manufacturer's operating limits.) The specific profile shall be defined in the individual test plans. (LS-71000, Section 5.4.1.1.6.1)

The TF-FGI QTT shall be conducted over a temperature range of 15°F (-9.4 °C) to 125°F (51.7 °C) centered about 70°F (21.1 °C). The hardware operational temperature range shall be between 50°F (10 °C) and 90°F (32.2 °C).

4.3.1.2 Acceptance Thermal Cycling

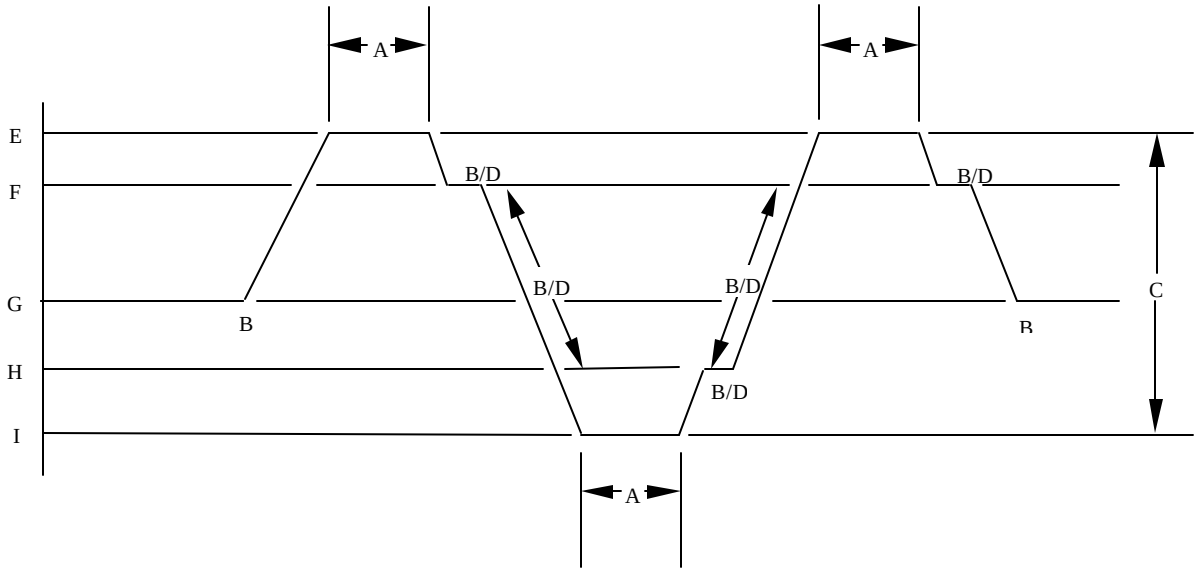
The Acceptance Thermal Cycle Test shall be conducted over a temperature range of 100°F (55.6 °C) centered about the hardware normal operating temperature as defined in the test plan. The hardware shall be functionally tested before and after the temperature test, at each transition, and at each stable temperature. The hardware shall not be functionally tested at temperatures in excess of the defined operating temperature range. (Hardware shall be unpowered when outside the manufacturer's operating limits.) One cycle is defined as starting from normal operating temperature, increasing to the maximum high temperature, decreasing to the minimum low temperature, and then returning to the normal operating temperature as depicted in Figure 4.3.1.2-1. The complete test consists of one and one-half (1½) thermal cycles with one-hour soaks at each extreme. Minimum temperature sweep shall be 100 °F around the normal operating temperature, and the hardware shall dwell at the temperature extremes for a minimum of 1 hour. (LS-71000, Section 5.4.1.1.6.2)



NOTES:

1. A = Time to stabilize equipment temperature plus 1-hour minimum.
2. B = Functional tests to be performed as shown.
3. C = Control temperature range between high and low acceptance test conditions shall be a minimum of 61.11°C (110°F). Contractor is to specify tolerances on stable temperature periods.
4. D = Simplified Functional Test. Rate of temperature change during temperature transition shall not be less than 0.55°C (1°F)/min. nor greater than 2.22°C (4°F) (4°F)/min.
5. E = Median operational temperature plus 30.56°C (55°F).
6. F = Maximum operational temperature.
7. G = Median operational temperature.
8. H = Minimum operational temperature.
9. I = Median operational temperature minus 30.56°C (55°F).

Figure 4.3.1.1-1. Qualification Thermal Cycling



NOTES:

1. A = Time to stabilize equipment temperature plus 1-hour minimum.
2. B = Functional tests to be performed as shown.
3. C = Control temperature range between high and low acceptance test conditions shall be a minimum of 55.56°C (100°F). Contractor is to specify tolerances on stable temperature periods.
4. D = Simplified Functional Test. Rate of temperature change during temperature transition shall not be less than 0.55°C (1°F)/min. nor greater than 2.22°C (4°F) (4°F)/min.
5. E = Median operational temperature plus 27.78°C (50°F).
6. F = Maximum operational temperature.
7. G = Median operational temperature.
8. H = Minimum operational temperature.
9. I = Median operational temperature minus 27.78°C (50°F).

Figure 4.3.1.2-1. Acceptance Thermal Cycling

The TF-FGI Acceptance Thermal Test (ATT) shall be conducted over a range of 20 °F (-6.7 °C) to 120 °F (48.9 °C) centered about 70°F (21.1 °C). The hardware operational temperature range shall be 50°F (10 °C) to 90°F (32.2 °C).

4.3.2 Vibration Tests

Qualification for Acceptance Random Vibration Test levels are as described in Section 4.3.2.1. Acceptance Random Vibration Test levels are as described in Section 4.3.2.2.

4.3.2.1 Qualification for Acceptance Random Vibration Test

Qualification for Acceptance Vibration Testing (QAVT) determines the number of Acceptance Vibration Tests that may be run on flight units. QAVT shall be run on dedicated qualification test hardware only. The QAVT for HRF equipment shall be performed at a 7.93 g rms composite level over the frequency range and spectral density defined in Table 4.3.2.1-1. QAVT shall be conducted at 1.69 times the Acceptance Random Vibration Test levels. QAVT duration shall be the Acceptance Vibration Testing (AVT) duration multiplied by the number of AVTs for which the hardware is to be qualified. (LS-71000, Section 5.4.1.1.3.2)

TABLE 4.3.2.1-1. QUALIFICATION ACCEPTANCE RANDOM VIBRATION TEST LEVELS

Frequency Range (Hz)	**Minimum Power Spectral Density (g^2/Hz)**
20	0.017
20 - 80	3 dB/Octave Slope
80 - 350	0.067
350 - 2000	-3 dB/Octave Slope
2000	0.0118
Composite	7.93 g rms

4.3.2.2 Acceptance Random Vibration Test

AVT is used to screen defects in workmanship that cannot be detected by inspection. AVT for TF-FGI shall be performed at a 6.1 g rms composite level over the frequency range and minimum AVT levels defined in Table 4.3.2.2-1. Vibration duration shall be a minimum of 60 seconds in each of three axes. Functional/continuity tests shall be conducted on components before, during, and after the AVT. (LS-71000, Section 5.4.1.1.3.3)

TABLE 4.3.2.2-1. ACCEPTANCE RANDOM VIBRATION WORKMANSHIP TEST LEVELS

Frequency Range (Hz)	Minimum Power Spectral Density (g^2/Hz)
20	0.01
20 - 80	+3 dB/Octave - Slope
80 - 350	0.04
350 - 2000	-3 dB/Octave - Slope
2000	0.007
Composite	6.1 g rms

4.3.3 Functional Testing

Abbreviated and full functional test procedures shall be as specified in a TPS or a released procedure.

Functional tests are performed to validate the operation of the TF-FGI flight hardware. Functionals make up the core of certain tests and can be performed before and after environmental testing. The functional test done prior to testing establishes the functional state (or baseline) of the hardware while the functional done after testing evaluates its ability to withstand the test levels.

An abbreviated functional will be used to test the functional state of the hardware during some environmental testing (i.e., thermal, vibration, bench handling, etc.). The intended use of an abbreviated functional is to verify nominal hardware function between test stages.

4.3.4 Electrical, Electronic, and Electromechanical Parts Control, Selection, and Burn-In

A. Compliance with 3.4.4.A is considered successful when it can be shown via analysis that the parts control process is compliant with 3.4.4.A.

B. Compliance with 3.4.4.B is considered successful when an analysis is provided which includes a risk assessment, electrical stress analysis, and data delivery on information such as designed/as-built EEE parts, list, construction history, Government and Industry Data Exchange Program (GIDEP) Alerts, part obsolescence, radiation susceptibility, and/or prior history.

C. The burn-in test may be accomplished at the component or assembly level, and is specified as:

- 72 hrs continuously at room ambient temperature while functioning
- 96 hrs continuously at a specified controlled temperature while functioning.

Full functional tests shall be performed on the experiment hardware before and after the burn-in test. Controlled temperature is defined as 15 °C below the maximum rating of the device with the lowest temperature rating in the article under test. (LS-71000, Section 5.4.1.1.10)

All flight assemblies utilizing non-military parts (as specified in Section 3.4.4) shall undergo burn-in testing. (LS-71000, Section 5.4.1.1.10)

4.3.5 Flammability

Payload materials shall be non-flammable or self-extinguishing per the test criteria of NASA-STD-6001, Test 1, Flammability, Odor, Offgassing, and Compatibility Requirements and Test Procedures for Materials in Environments that Support Combustion. The material shall be evaluated in the worst-case use environment at the worst-case use configuration. When the use of a non-flammable material is not possible, a Material Usage Agreement (MUA) or equivalent shall be submitted to the cognizant NASA center for disposition. If test data does not exist for a material, the experimenter may be asked to provide samples (see NASA-STD-6001, Chapter 4) to a NASA certified test facility - Marshall Space Flight Center (MSFC) or White Sands Test Facility (WSTF) or flammability testing).

Materials transported or operated in the orbiter cabin, or operated in the ISS air lock during Extravehicular Activity (EVA) preparations, shall be tested and evaluated for flammability in the worst-case use environment of 30% oxygen and 10.2 psia. Materials used in all other habitable areas shall be tested and evaluated in the worst-case use environment of 24.1% oxygen and 15.2 psia. (LS-71000, Section 5.4.1.1.8)

4.3.6 Offgassing

All flight hardware located in habitable areas shall be subjected to test and meet the toxicity offgassing acceptance requirements of NASA-STD-6001, Test 7. (LS-71000, Section 5.4.1.1.9)

4.3.7 Bench Handling

A bench handling test shall be performed on the qualification unit for all hardware. If there is no qualification unit, analysis may be substituted for test. The bench handling test shall be conducted in accordance with MIL-STD-810, Section 516.4, I3.6, Procedure 4 or 6 with the following modifications: Test conditions of 26 drops altered to two (2) drops. Surfaces, corners, and edges shall be identified in the test procedure. (LS-71000, Section 5.4.1.1.5)

4.3.8 Payload Mass

TF-FGI shall comply with LS-71014, Mass Properties Control Plan. (LS-71000, Section 5.4.1.1.1)

4.3.9 Electromagnetic Compatibility

The TF-FGI shall comply with LS-71016, HRF EMI/EMC Control Plan. (LS-71000, Section 5.4.1.2.1)

4.3.10 Acoustic Noise

Not applicable to the TF-FGI.

4.3.11 Pre-Delivery Acceptance

The responsible manufacturing parties shall perform a Pre-Delivery Acceptance (PDA) after the complete fabrication and assembly has been conducted for all Class I deliverable assemblies. This test shall include verification of software interface and operation. The PDA must be completed before hardware certification testing begins. It is a full functional test and inspection that validates that the hardware operates per the design requirements and that it is constructed per released engineering drawings. All PDA tests shall be approved by the hardware's JSC technical monitor and JSC/NT3, as well as the contractor's quality engineering representative (if applicable). The following are standard steps that each PDA test shall contain:

1. Conformance to Drawing. Verify that the hardware conforms to released engineering drawings.
2. No Sharp Edges. Inspect the hardware to verify that there are no sharp edges or corners present.
3. Proper Identifying Markings. Verify that the hardware has the proper part number and serial number (if applicable) on it.
4. Cleanliness. All PDA tests shall include verification that all surfaces (external, internal, etc.) are to the cleanliness level of Section 3.3.1.1C of this document.

5.0 PREPARATION FOR SHIPMENT

5.1 GENERAL

A. The methods of preservation, packaging, and packing used for shipment, together with necessary special control during transportation, shall adequately protect the article(s) from damage or degradation in reliability or performance as a result of the natural and induced environments encountered during transportation and subsequent indoor storage. (LS-71000, Section 9.1A)

B. To reduce program cost, prior to developing a newly designed container, every effort will be made by project participants to use container designs and/or containers available commercially or from Government inventories. If reusable containers are not available, a screening process should be initiated for container availability in the following priority: existing containers, COTS containers, and modified COTS containers. Shipping containers and protective devices will be designed for effective and economical manufacture, procurement, and transportability. (LS-71000, Section 9.1B)

5.2 PACKING, HANDLING, AND TRANSPORTATION

A. Packaging, handling, and transportation shall be in accordance with applicable requirements of NHB 6000.1C, and referenced documents therein. (LS-71000, Section 9.2A)

B. Documented procedures and physical controls shall be established to ensure that the HRF rack and individual items of equipment will not be subjected to temperature, shock, and humidity outside the non-operational limits during shipment. (LS-71000, Section 9.2C)

C. The TF-FGI shall be cleaned to the "Visibly Clean Level 1 (Sensitive)" as determined in JSC-SN-C-0005, Specification Contamination Control Requirements for the Shuttle Program. (LS-71000, Section 9.2D)

5.3 PRESERVATION AND PACKING

Preservation and packing shall be in accordance with approved Packaging, Handling, and Transportation Records (PHTRs). (LS-71000, Section 9.3)

5.4 MARKING FOR SHIPMENT

Interior and exterior containers shall be marked and labeled in accordance with NHB 6000.1C including precautionary markings necessary to ensure safety of personnel and facilities, and to ensure safe handling, transport, and storage. Should the individual items of equipment contain any hazardous materials,

markings shall also comply with applicable requirements governing packaging and labeling of hazard materials. Packages with reuse capability shall be identified with the words "Reusable Container - Do Not Destroy - Retain for Reuse." NASA Critical Item Labels (Form 1368 series) shall be applied in accordance with NHB 6000.1C. (LS-71000, Section 9.4)

5.5 NASA CRITICAL SPACE ITEM LABEL

The NASA Critical Space Item Labels Form 1368 shall be affixed to exterior and interior shipping containers in accordance with NHB 6000.1C. (LS-71000, Section 9.5A)

6.0 NOTES

This section contains information of a general or explanatory nature that may be helpful but is not mandatory.

6.1 DEFINITIONS

Qualification Test	Test conducted as part of the verification program to demonstrate that the design and performance requirements can be realized under specified conditions.
Acceptance Test	Formal test conducted to ensure that the end item meets specified requirements. Acceptance test includes performance demonstrations and environmental exposures to screen out manufacturing defects, workmanship errors, incipient failures, and other performance anomalies not readily detectable by normal inspection techniques or through ambient functional tests.
Active Air Exchange	Forced convection between two volumes. For example, forced convection between a subrack payload and the internal volume of an integrated rack, or forced convection between a subrack payload and cabin air.
Continuous Noise Source	A significant noise source that exists for a cumulative total of 8 hours or more in any 24-hour period is considered to be a continuous noise source.
Intermittent Noise Source	A significant noise source that exists for a cumulative total of less than 8 hours in a 24-hour period is considered to be an intermittent noise source.

No.	**Standard #**	**Abbreviated Requirement**	**App.**	**Comments**
	GENERAL			
	G-1	Equipment Accessibility for Maintenance	✓	Inspect drawing, design, and hardware.
	G-2	Separation of Redundant Equipment	N/A	Critical equipment requirement.
	G-3	Systems Checkout Provisions	E	Not cost effective for non-critical equipment.
	G-4	Protection of Spacecraft Electrical and Mechanical Systems from Debris	✓	Inspect drawing and design.
	G-5	Interior Design of Spacecraft for Cleanliness	N/A	Vehicle requirement.
	G-6	Redundancy Requirements	✓	
	G-7	Time Displays	E	Time displays on non-critical equipment are based on the display needs, not a generic time display requirement.
	G-8	Redundant Paths - Verification of Operation	N/A	Critical equipment requirement.
	G-9	Shatterable Material - Exclusion From Habitable Compartment	✓	Inspect H/W Item drawing and design.
	G-10	Control of Limited- Life Components	✓	
	G-11	Procurement Document Identification for Manned Space Flight Vehicle Items	N/A	Not a design requirement.
	G-12	Application of Previous Qualification Tests	✓	
	G-13	Shipping and Handling Protection for Space Flight Hardware	✓	
	G-14	Identification and Classification of Flight and Non-flight Equipment	✓	
	G-15	Equipment Failure - Verification of Flight Readiness	N/A	Not a design requirement.
	G-16	Operating Limits On Temperature – Controlled Equipment	N/A	Not a design requirement.
	G-17	Separate Stock for Space Flight Parts and Materials	✓	Reference assembly TPSs and ADP for evidence of traceability.
